

Sevaro Outpatient AI Platform

An AI-enabled outpatient neurology platform — our vision, and what's already built

From referral to follow-up — AI that extends your neurologists across the whole patient journey.

One AI-enabled pathway across the whole outpatient journey — referral → triage → history → exam → visit → follow-up → monitoring. Each step is clinician-grade AI, clinician-supervised and EHR-integrated, that lifts your clinic's capacity and extends beyond neurology to other specialties.

The stack

Component	What it does	Stage
Triage tool	Reads the referral notes (and outside testing) and applies Sevaro's urgency algorithm to recommend how soon the patient should be seen, which type of neurologist, and where to begin the workup — guiding your schedulers. Tunable to each health system's resources.	Live · refining
AI Historian	Captures the patient's history (OLD CARTS) by phone/text pre-visit or in-room, and drafts a clinician-grade summary + working differential into the EHR — collapsing 20–30 min of intake so visits run 15–20 min (~2 patients per slot), with higher-fidelity histories than manual intake.	Live route
SENSE exam	Standardized Digital Neurologic Exam for outpatient — a guided, recorded cranial-nerve / neuro exam on the Galaxy XR headset. Objective, repeatable, reads into the chart.	In build
AI follow-up	Automated post-visit follow-up — symptom check-ins, results & adherence tracking, and re-triage — closing the loop after the visit without a clinician touch.	POC
Remote patient monitoring	Wearable / biometric monitoring (watch, ring, phone) feeding ongoing outpatient management and earlier intervention between visits.	POC

What it delivers

- **Faster, smarter access** — every referral is read and prioritized in minutes, so the right patient sees the right neurologist at the right time, with workups ordered up front.
- **More capacity, same staff** — the Historian collapses intake so clinicians see more patients per slot, and the triage tool guides your schedulers — no new hires, and it fits your existing workflows.
- **Works with your team** — it augments your local neurologists and coordinators and adapts to your health system's resources, so your specialists practice at the top of their license.
- **Safe by design** — clinician-supervised throughout, with built-in red-flag alerts that surface urgent presentations for immediate attention.

Stages: Live = in use · In build = in active development · POC = proof-of-concept. Several capabilities are advancing through internal and partner validation studies.
